

Turn after-hours air conditioning into a business

There are other after-hours building services interfaces available - ***Aura is different!***

- Retro-fit to ANY building to control lighting and/or air conditioning
- Full usage reporting and administration via the internet
- Schedule requests up to a year in advance

Utilising the AURA web interface, tenants and property professionals have access to their lighting and/or air conditioning 24 hours a day.

Tenants can schedule activation or view usage via the internet. All usage is logged in the AURA database, with date, username, activation time and duration stamped against each request.

By accessing the standard administration package, property professionals can print invoices, export usage data or modify tenants details without ever having to visit the premises.

AURA can be interfaced with any type of lighting or air conditioning system or can operate "stand-alone",

activating building services, not just after-hours, but also during normal operating hours with the integrated time clock. AURA will also schedule daylight savings changes and public holidays automatically.

Unlike most other systems, AURA also guarantees that the system we install will be supported for the life-cycle of the building.

Whether your portfolio is one building or one hundred, AURA makes the activation and administration of building services simple and convenient.

Contact AURA *now* and turn your after-hours nightmare into an after-hours profit!
